The project is a web application designed for people aged 14–19. The application will help adolescents balance studying and working. The platform will assist young people in finding jobs and in ensuring compatibility with work permits and school schedules. It will also provide information about administrative risks related to compliance with labor legislation. In general, employers find it difficult to locate a local and reliable young workforce because there is no centralized, age-adapted platform for verifying work permits and compatibility with school schedules. Additionally, there are significant administrative risks associated with complying with legislation on the employment of minors. This platform can address these challenges. The system is built on the React technology stack and includes a profile creation feature without a résumé, which transforms personal skills and extracurricular achievements into employment-relevant data. A backend engine will also be implemented to automatically filter job vacancies based on regional regulations concerning the employment of minors. This project creates a scalable and secure framework for early career development in the digital labor market.
