Karst process takes place in water-soluble rocks (limestone, dolomite, chalk, gypsum) under the influence of underground and surface water flows. There are many types of cavities in the earth's crust. Caves formed by the action of various natural factors are united in the "group of natural caves". The report discusses the classification of karst caves, the factors of the formation of caves, the authors of karst caves, the reasons for their formation and forms of distribution. Characterization of sedimentary aggregates of karst caves of Georgia on the example of Prometheus cave.
