In the modern digital era, establishing social connections between people remains a significant challenge, especially for students and young individuals who are trying to integrate into a new environment. This issue often leads to communication difficulties and social isolation. The presented project, “Meetory,” is a social web application designed to simplify and accelerate the process of finding new friends based on shared interests, hobbies, and activities.

The main challenge of the project is to develop an efficient and personalized matching mechanism that analyzes user data and recommends suitable candidates. For the implementation of the system, modern web technologies such as HTML, CSS, and JavaScript are used, along with a server-side architecture and a database where user profiles, interests, and communication history are stored. The application also includes registration and authentication systems, profile management, and messaging functionality, ensuring safe and convenient communication between users.

The expected result is the creation of a user-friendly, fast, and secure platform that promotes stronger social relationships, helps users establish new connections, and increases student engagement within the community. The system can be applied both in universities and in other social environments to effectively connect people.

Keywords: web application, social network, friend finding, matching system, database.
