Funded by Horizon Europe Real-Time Monitoring Networks and Transport Emissions for Tailored Zero Pollution Action Plans in European Cities (acronym Net4cities, project ID: 101138405) is a project, composed of a consortium of partners from 11 European countries, including academic research institutes and universities, private companies, and public environment authorities. This transdisciplinary consortium is coordinated by the Research Institute for Sustainability at GFZ (RIFS; Potsdam, Germany)

The overall aim of Net4Cities is to facilitate the realization of the EU Green Deal's Zero Pollution Action Plan by advancing air and noise pollution monitoring infrastructure and providing evidence-based support for implementing effective transport policies via the Net4Cities Studio products and thereby improving air quality and mitigating noise pollution.

Since measurement campaigns are not just started, presented data is preliminary, following presentation will focus on general overview of the project and give details of the part of the measurement campaign conducted at TSU.
