Address: 1 I. Tchavtchavadze Avenue, Tbilisi

More than 30 years have passed since the 1992-1993 war and the occupation of Abkhazia. During this time, no meteorological observations were conducted and are not being conducted to this day in the territory of the Autonomous Republic of Abkhazia (if observations are being conducted, these data are not available to us, nor the international scientific or wider community). Before the hostilities and the occupation of the Autonomous Republic of Abkhazia, regular meteorological observations were conducted at 11 meteorological stations located there, namely Babushera, Bichvinta, Gagra, Gagra range, Gali, Kvezani, Ochamchire, Pskhu, Lata, Sukhumi, and Gudauta. It is based on data from these meteorological stations that the multi-year changes in the main climate elements, in particular, the average and extreme values of temperature and precipitation, have been studied during 1955-1985.

The study was carried out within the TSU student scientific project: "Investigation of climate changes in the territory of the Autonomous Republic of Abkhazia based on meteorological observation data during 1955-1985".

Keywords: Autonomous Republic of Abkhazia, temperature, precipitation
